                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDLINE=88246461; PubMed=2837660;
Lai Z.-C., Childs G.;
"Characterization of the structure and transcriptional patterns of the gene encoding the late histone subtype H1-beta of the sea urchin Strongylocentrotus purpuratus.";
Mol. Cell. Biol. 8:1842-1844(1988).
-I- FUNCTION: HISTONES H1 ARE NECESSARY FOR THE CONDENSATION OF NUCLESCENDE CHARINS INTO HIGHER ORDER STRUCTURES.
-I- SUBCELLULAR LOCATION: Nuclear.
-I- SIMILARITY: BELONGS TO THE HISTONE H1/H5 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    InterPro; IPR0013186; Histone H1/H5.

ANYB2571 to AAYB2577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight copolymer. The polypeptides of the invention are used as molecular weight markers for golypeptides of the invention are used as molecular weight markers for glatinamer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or retributed diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple steleorists, rheumarcing arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune cophoritis, contact sensitivity disease, diabetes mellitus, Graves disease, Gillain-Barre's syndrome, Hashimoro's disease, alidopathic myxoedema, myasthenia gravis, psyndrome, Hashimoro's disease, and delated-mediated diseases which can be treated include host-versus-graft disease, graft-versus-host disease, and delated-mediated diseases which are analogous to molecular weights and physical properties which are analogous to molecular weights melecules, which makes them ideal for use as
                                                                                                                                Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases
                                                                                                                                                                                                               Claim 10; Page 14; 72pp; English

weight TV-marker polypeptides from the present invention. The present invention describes polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight con and an amino acid composition corresponding to the copolymer. The copolymer invention are used as molecular weight markers for glatizamer accetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple scleenyelinating diseases. Such diseases incliment haemolytic anaemia, autoimmune ophoritis, osteoarthritis, autoimmune haemolytic unecerimitis, Crohn's disease, chonic immune thyroiditis, autoimmune uvecreinitis, crohn's disease, chonic immune thyroiditis, autoimmune uvecreinitis, crohn's disease, habinoto's disease, idiopathic myxoedema, myasthenia gravis, psentiasis, pemphigus vulgaris, or systemic illust erythematosus Mediated mediated diseases which can be treated include the contact sensitivity disease, diabetes mediated myasthemic collinations are madiated mediated diseases which can be treated include the contact sensitivity disease, diabetes mediated myasthemic collinations are mystemic contact sensitivity disease, diabetes mediated collinations and contact sensitivity disease, diabetes mediated collinations and collinations and collinations and collinations are demonstrated myxoedema, myasthemic sensitivity diseases which can be treated collinations and collinations and collinations and collinations and collinations and collinations and collinations are collinated mysthemic collinations and collinati
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     5
                     glatiamer acetate; autoimmune disease; antiarthritic; neuroprotective; osteopathic; immunosuppressive; antihyroid; antiinflammatory; antidiabetic; thyromimetic; haemostatic; antipsoriatic; dermatory antianaemic; immunosuppressive; demyalinating disease; osteoarthritis; inflammatory condition; multiple sclerosis; rheumatoid arthritis; crohn's disease; chronic immune thrombocytopaenia purpura; colitis; diabetes mellitus; Graves disease; Guillain-Barre's syndrome; psoriasis; Hashimoto's disease; idiopathic myxoedema; myasthenia gravis; pemphigus vulgaris; systemic lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases

The polypeptides of the invention defined molecular weights and physical proporties which are analoglatinamer acetate molecules, which makes them ideal for use as
Copolymer, molecular weight marker; TV-marker; immune disease;

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight of and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatinamer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune hacmolytic ansemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune thrombocytopaenia uveoretinits, crohn's disease, chronic immune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus Graves disease, myasthenia gravis, psyndrome, Hashimoto's disease, allique erythematosus. Mediated-mediated disease, which can be treated include host-versus-graft disease, graft-versus-short disease, and colletined molecular weights and phypeptides of the invention have defined molecular weights and phypatical properties which are analogous to molecular weights molecules, which makes them ideal for use as along the molecular weights molecules which markes them ideal for use as
                                                                                                                                                                                                                                   optoprime, morrous market, include the morror of a distribution to the morror of antidabetic; immunosuppressive; antichyroid; antidabetic; thyromientic; heamediatic; antipacoriatic; dermaclogical; antidanaemic; immunosuppressive; demyelinating disease; osteoarthritis; inflammatory condition; multiple sclerosis; rheumatoid arthritis; crowing sissease; chronic immune thrombocytopeania purpura; colitis; diabetes mellitus; Graves disease; dullain-Barre's syndrome; psoriasis; Hashimoto's disease; idiopathic myxoedema; myasthenia gravis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases
                                                                                                                                                                       Copolymer molecular weight TV-marker amino acid sequence SEQ,ID NO:7.

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular weight of a copolymer (CP), which has an identified molecular weight end ocid composition corresponding to the copolymer. The colypeptides of the invention are used as molecular weight markers for polypeptides of the invention are used as molecular weight markers for golypeptides of the invention are used as molecular weight markers for glatinamer acetate related tetrapolymers. The polypeptides may also be used for treated include either cell-mediated or antibody-mediated diseases and inflammacry conditions, e.g. multiple antibody-mediated diseases and inflammacry conditions, e.g. multiple canemia, autoimmune ophoritis, osteoarthritis, autoimmune haemolytic sclerosis, rheumatoid arthritis, osteoarthritis, autoimmune baemolytic anaemia, autoimmune ophoritis, autoimmune thrombocytopaenia cuecerinitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barrer's syndrome, Hashimoto's disease, diabetes mellitus, contact sensitivity disease, diabetes mellitus, crastemic myxoedema, myasthenia gravis, psoriasis, pemphigus vulgaris, or systemic lupus erythematosus. Mediated meledated diseases which can be treated deliaped-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as
                                                                                                                                                                                                                                                                                                                                                                                                                             glatiramer acetate; autoimmune disease; antiarthritic; neuroprotective; osteopathic; immunosuppressive; antibhyroid; antiinflammatory; osteopathic; immunosuppressive; antibhyroid; antiinflammatory; dermatory; antianaemic; immunosuppressive; demyelinating disease; osteoarthritis; inflammatory condition; multiple sclerosis; rheumatoid arthritis; crohn's disease; chronic immune thrombocytopaenia purpura; colitis; diabetes mellitus; Graves disease; Guilain-Barre's syndrome; psoriasis; Hashimoto's disease; idiopathic myxoedema; myasthenia gravis; pemphigus vulgaris; systemic lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases
Copolymer molecular weight TV-marker amino acid sequence SEQ ID NO:2.
                                                                                                                                                                                                                                                                                                                                                                                                            Copolymer; molecular weight marker; TV-marker; immune disease;
                                                                                             AAY82572 standard; peptide; 45 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 10; Page 14; 72pp; English.

                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and to hosynthesis and biodegradation, especially biosynthesis of vitemain B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related organisms.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip. wipo.int/pub/published_pot_sequences.
                                                                               4;

The resulting plasmids encode fusion proteins consisting of beta-glucuronidase, Protein A, and rCOP-1 sequences. A methionine residue occurs between the Protein A and rCOP-1 sequences. Sequences, originating from the 5' linker sequence, in order that the COP-1 polypeptide may be cleaved from the fusion protein. TCOP-1-19 contains oligonucleotide duplexes incoding the following segments: YKK, AAB, KAK, EXA, KRA, KRA, KRA, KRA, KRA, KRA, and AAA. The Neterminal alanine residue is left behind following CNBr cleavage of the

AAY82571 to AAY82577 represent specifically claimed copolymer molecular weight TV-marker polypeptides from the present invention. The present invention describes polypeptides (1) for determining the molecular response to a copolymer (CP), which has an identified molecular weight of a copolymer (CP), which has an identified molecular weight and an amino acid composition corresponding to the copolymer. The polypeptides of the invention are used as molecular weight markers for glatiramer acetate related tetrapolymers. The polypeptides may also be used for treating and preventing immune diseases in a mammal. Autoimmune diseases which may be treated include either cell-mediated or antibody-mediated diseases. Such diseases include arthritic conditions, demyelinating diseases and inflammatory conditions, e.g. multiple sclerosis, rheumatorid arthritis, osteoarthritis, autoimmune haemolytic anaemia, autoimmune cophoritis, autoimmune thyroiditis, autoimmune uveoretinitis, crohn's disease, chronic immune thrombocytopaenia purpura, colitis, contact sensitivity disease, diabetes mellitus, Graves disease, Guillain-Barre's syndrome, Hashimoto's disease, didopathic myxoedema, myasthenia gravis, psyndrome, Hashimoto's disease, didopathic myxoedema, myasthenia gravis, peemphigus vulgaris, or systemic lupus erythematosus. Mediated-mediated diseases which can be treated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Copolymer; molecular weight marker; TV-marker; immune disease; glatiramer acetate; autoimmune disease; antiarthritic; neuroprotective; osteopathic; immunosuppressive; antithyroid; antiinflammatory antiantamic; immunosuppressive; hemostatic; antipocriatic; dermacological; antianaemic; immunosuppressive; demyelinating disease; osteoarthritis; inflammatory condition; multiple sclerosis; rheumatoid arthritis; inflammatory condition; multiple sclerosis; rheumatoid arthritis; diabetes mellitus; Graves disease; Guillain-Barre's syndrome; politis; Hashimoto's disease; idiopathic myxoedema; myasthenia gravis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Copolymer 1 related polypeptides used as molecular weight markers for glatiramer acetate and for treatment and prevention of immune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                          Copolymer molecular weight TV-marker amino acid sequence SEQ ID NO:1.

nucleic acid to a coll. The system comprises a nucleic acid binding complex, consisting of a binding molecule bonded non-covalently to the nucleic acid, and covalently to a surface ligand, and a lytic agent. The binding molecule is spermine or a spermidine derivative. Nucleotide sequences AAA36633-A36652 and peptide sequences AAY98456-Y98500 are used in the construction of the transporter system of the invention. The transporter system is used in gene therapy, particularly to deliver nucleic acids to hepatocytes, muscle cells or bone forming cells, e.g for treating cardiovascular disease, cancer, and infection. The transporter systems are also used to create transgenic animals (as models for human carcinogenesis or disease or for desting. Other uses include transforming cells to produce proteins, or transfecting cells in vitro to study the function of the nucleic acid. The use of a surface ligand allows specific targeting of selected cells and tissues. The lytic agent provides for release of the nucleic acid into the cellular interior, from endosomes, without requiring endosomal or lysosomal
                                                                                                                                                                                  2,
                delayed-type hypersensitivity. The polypeptides of the invention have defined molecular weights and physical properties which are analogous to glatiramer acetate molecules, which makes them ideal for use as molecular weight markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       therapy and for generating transgenic animals, comprises binding agent linked to nucleic acid, surface ligand and lytic agent

The NTS contains but is not limited to 5 components: (a) the nucleic acid or a macromolecule to be delivered; (b) a molety that recognizes and binds to a cell surface receptor or antigen or is capable of entering a cell through cytosis, (c) a nucleic acid or macromolecular molecule binding moiety, (d) a moiety that is capable of moving or initiating movement through a nuclear membrane; and/or (e) a lysis moiety that enables the transport of the entire complex from the cells urface directly into the cytoplasm of the cell. The NTS delivers nucleic acid into the cellular interior as well as the nucleus of specific cells. The NTS can be used to treat disorders by targeting specific nucleic acid accordingly. The NTS can also be used to create transpont animals for a spessing human disease, such as cancer, in an animal model. The NTS can be used in vitro with tissue culture cells which allows the role of various nucleic acids to be studied by targeting specific expression into specifically targeted tissue culture cells. The lysis agent within the NTS avoids the problem of endosomal/lysosomal
                                                                       5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence represents poly-Lys-Ala, used to bind nucleic acid in a nucleic acid transporter system. The nucleic acid transporter system uses nucleic acid binding complexes containing surface ligands which are capable of binding to a cell surface receptor and entering the cell through cytosis. The compounds of the invention are either ligands, binding molecules (surface ligands), lysis agents, spacer molecules or their intermediates. The ligands, binding molecules, lysis agents and spacer molecules are used in nucleic acid transporter systems to deliver nucleic acid into specific cells e.g. in gene therapy to deliver nucleic acid into hepatocytes, muscle cells or bone forming cells.
                                                                                                                                                                                                                                                                            spacer molecule;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acid transport system, useful for creating transgenic animals for assessing human disease such as cancer in an animal model -

To improve the expression of rCOP-1 polypeptides in B. coli, genes coding for rCOP-1-77 were subcloned from pREV 2.1 to pBG3-2deltaN (deposit: 20-NOV-1984 US(469100), MRLB B-15910), a plasmid used to express Protein A. The resulting plasmids encode fusion proteins consisting of beta-glucuronidase, Protein A, and rCOP-1 sequences.

A methionine residue occurs between the Protein A and rCOP-1 sequences. The cop-1 polypeptide may be cleaved from the fusion protein. The COP-1 polypeptide may be cleaved from the fusion protein. rCOP-1-77 contains oligonucleotide duplexes incoding the following segments: YKK, BEL KAK, AAK, and AAA. The N-terminal alanine residue is left behind following CNBr cleavage of the fusion protein. They are used to prevent, arrest or control a encephalomyelitis. They are used to prevent, arrest or control a demyelinating disorder, e.g. multiple sclerosis. They may also be used as additives to hair care products to confer beneficial effects on damaged hair or as supplements for diets deficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               63 AEAAAEAEKAKYKKKAKEAEYKKKAKAAAEAEYKKEAEEAEYKKYKKKAKKAKKAKKAKE 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to a cell, comprising a binding complex comprising a ligand binding molecule noncovalently bound to a nucleic acid and covalently linked to a surface ligand, and a second binding complex comprising a second binding molecule noncovalently bound to a nucleic acid and covalently linked to a nuclear ligand. The complexes are simultaneously bound to the nucleic acid transporter system can also be used in a method for the in vivo targeting of the insertion of DNA into a cell. It can also be used in processes for producing transformed cell lines. The system can be used to deliver a variety or proteins and polypeptides, such as hormones, growth factors, enzymes, clotting factors, applipproteins, receptors, drugs, oncogenes, tunor antigens, tunor
                                                                                                                                                                                                                       Nucleic acid delivery, nucleic acid transporter system; hormone; enzyme; growth factor; clotting factor; apolipoprotein; receptor; drug; oncogene; tumor antigen; tumor suppressor; viral antigen; parasitic antigen; bacterial antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel system (I) for delivering a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   suppressors, viral antigens, parasitic antigens, and bacterial antigens. The transporter system uses lysis agents to overcome the problems of endosomal/lysosomal degradation seen with prior art systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acid transporter system for delivering nucleic acid into a cell, useful for delivering proteins and polypeptides to cells, including growth factors, enzymes, hormones, and tumor suppressors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 AKKYAK-KEKAYAKKAEKAAKKAEAKAYKAAEAKKKAEAKYKAEA-AKAAAKEAA 53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

The invention provides heat-killed Mycobacterium vaccae, or recombinant

M. vaccae proteins. The M. vaccae proteins may be employed to activate

T cells and natural killer cells, to stimulate the production of

cytokines, to enhance the expression of co-stimulatory molecules on

dendritic cells and monocytes, and to enhance dendritic cell maturation

and function. The proteins can be expressed by standard recombinant

and function. The proteins can be expressed by standard recombinant

and function, and detection comprising the proteins or

nucleic acid sequences encoding the proteins can be used for the

treatment, prevention, and detection of disorders including infectious

treatment are used for treatment of diseases of the respiratory system,

such as mycobacterial infections, asthma, allergies, tuberculosis,

such as mycobacterial infections, asthma, allergies of the skin such as

psoriasis, atopic dermatitis, ecreme, allergic contact dermatitis,

alopecia areata, and skin cancers such as basal carcinoma, squamous cell

JUNEAU SEQUENCE 3, Application US/09816989A

Fatent No. US20020115103A1

GENERAL INFORMATION:

APPLICANT: Gad, Alexander

APPLICANT: Lis, Doris

TITLE OF INVENTION: COOLUMER I RELATED POLYBEPTIDES FOR USE AS MOLECULAR WEIGHT MARKI

TITLE OF INVENTION: AND FOR THERAPEUTIC USE

TITLE OF INVENTION: AND FOR THERAPEUTIC USE

TITLE OF INVENTION: AND FOR THERAPEUTIC USE

FILE REFERENCE: 2609/60807-A-PCT-US

CURRENT FILING DATE: 2001-03-23

PRIOR PAPLICATION NUMBER: PCT/US99/22402

PRIOR PAPLICATION NUMBER: PCT/US99/22402

PRIOR PILING DATE: 1999-09-24

NUMBER OF SEQ ID NOS: 7

SEQ ID NO 3

LENGTH: 56

GENERAL INFORMATION

TITLE OF INVENTION: Methods and Compounds for the Treatment

TITLE OF INVENTION: Methods using Mycobacterium Vaccae

TITLE OF INVENTION: OF Immunologically-Mediated Diseases of the Respiratory

TITLE OF INVENTION: OF Immunologically-Mediated Diseases of the Respiratory

TITLE OF INVENTION: OF Immunologically-Mediated Diseases of the Respiratory

TITLE OF INVENTION: OF IMMUNOSCA

TITLE OF INVENTION: 2002-01-18

FILE REFRENCE: 1990-17

PRIOR PILING DATE: 1997-12-23

NUMBER OF SEQ ID NOS: 208

SOUTHARE: PASESEQ for Windows Version 3.0

LENGTH: 223
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                OTHER INFORMATION: Description of Artificial Sequence: Synthetic Peptide

Patent No. 6177554

GENERAL INFORMATION:
APPLICANT: Woo, Savio L.C.
APPLICANT: Smith, Louis C.
APPLICANT: Gristiano, Richard J.
APPLICANT: Gottchalk, Stephen
TITLE OF INVENTION: NUCLEIC ACID TRANSPORTER SYSTEMS AND
TITLE OF INVENTION: METHODS OF USE
MUMBER OF SEQUENCES: 65

CORRESPONDENCE ADDRESS:
ADDRESSEE: Lyon & Lyon
